# Outline

---

- **Background**
- **Proposed Method**
- **Evaluation**
- **Conclusion**

# Edge Devices

## ■ Development of Edge Devices

- The count of devices is increasing
- Systems is becoming complex

## ■ Development of Systems on Edge Devices

- The **cost is becoming significant**
- The **reusability** of the code developed with traditional method is limited

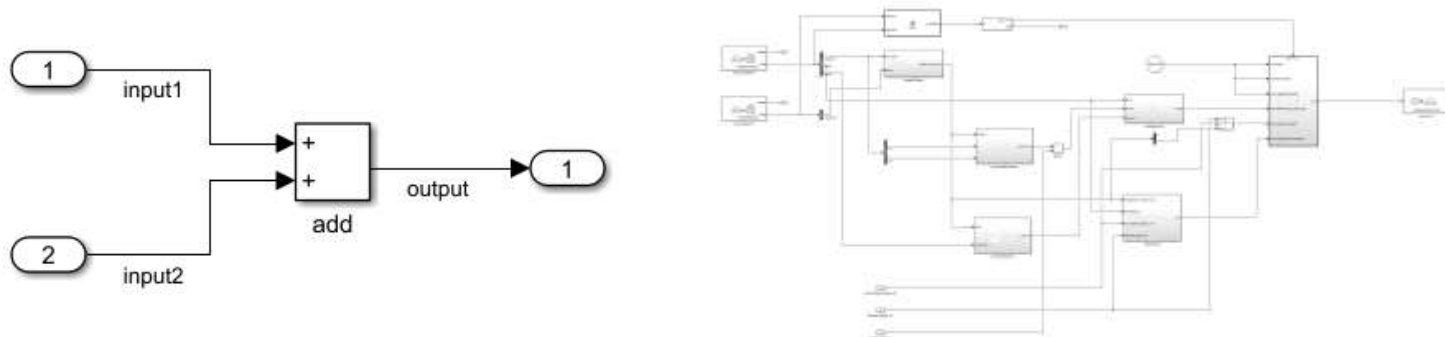

# Model-based Development (MBD)

## ■ MATLAB/Simulink

- MATLAB: a **programming and numeric computing platform** developed by MathWorks

- Simulink: a **block diagram environment** for Model-based Development integrated with MATLAB

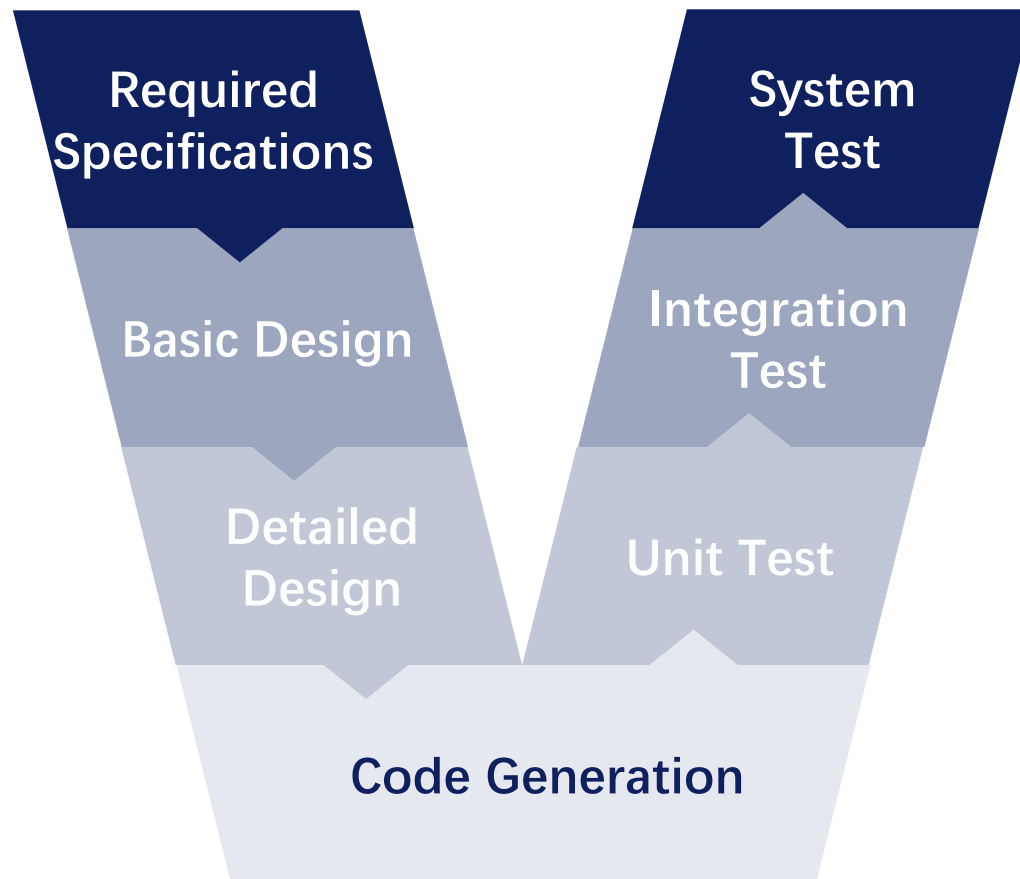

# Model-based Development (MBD)

---

## ■ V-Model

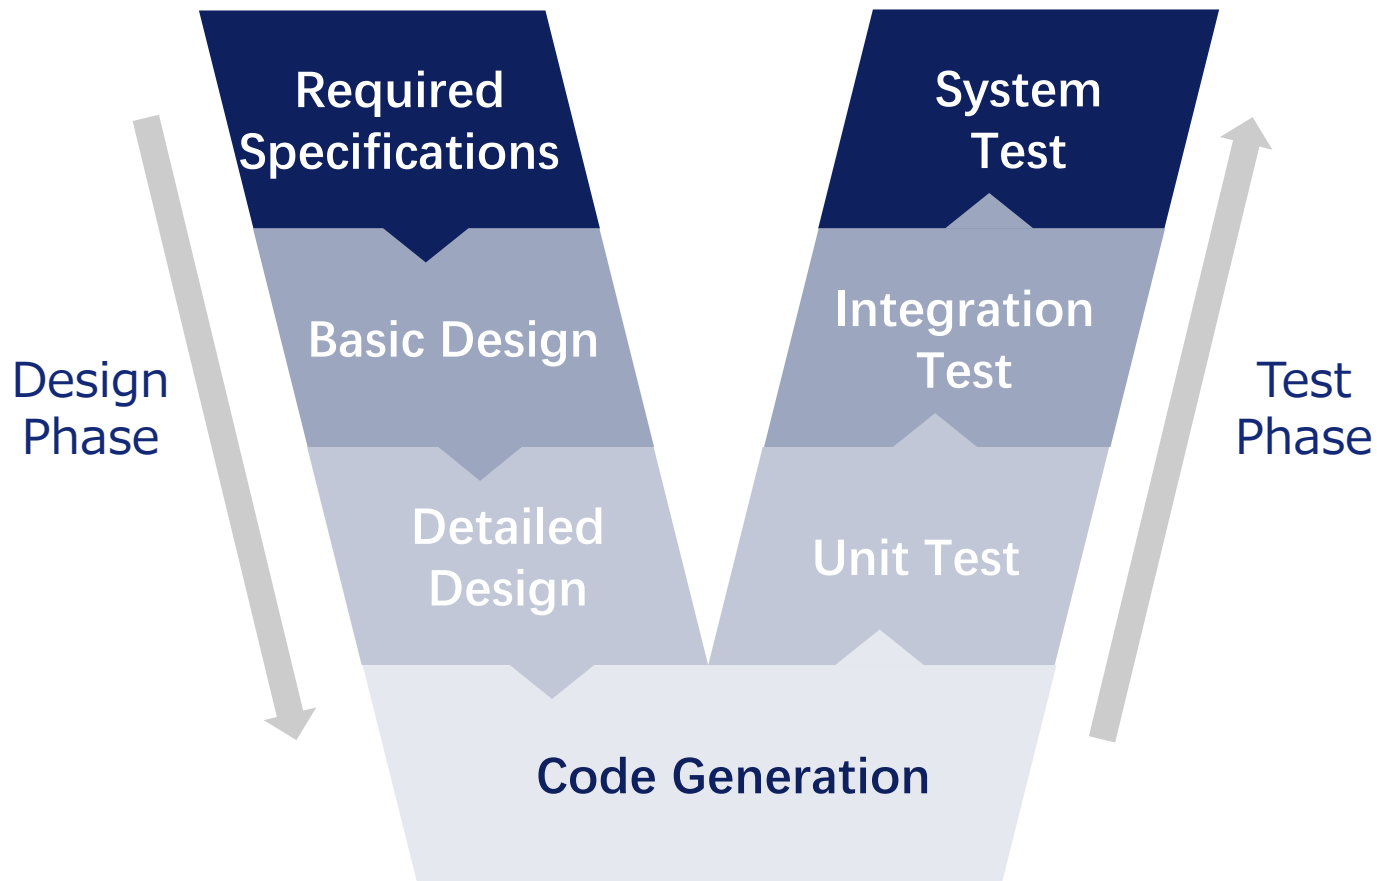

- A structured approach to system development that mirrors the stages of development with corresponding testing phases

# Model-based Development (MBD)

## ■ Design Phase

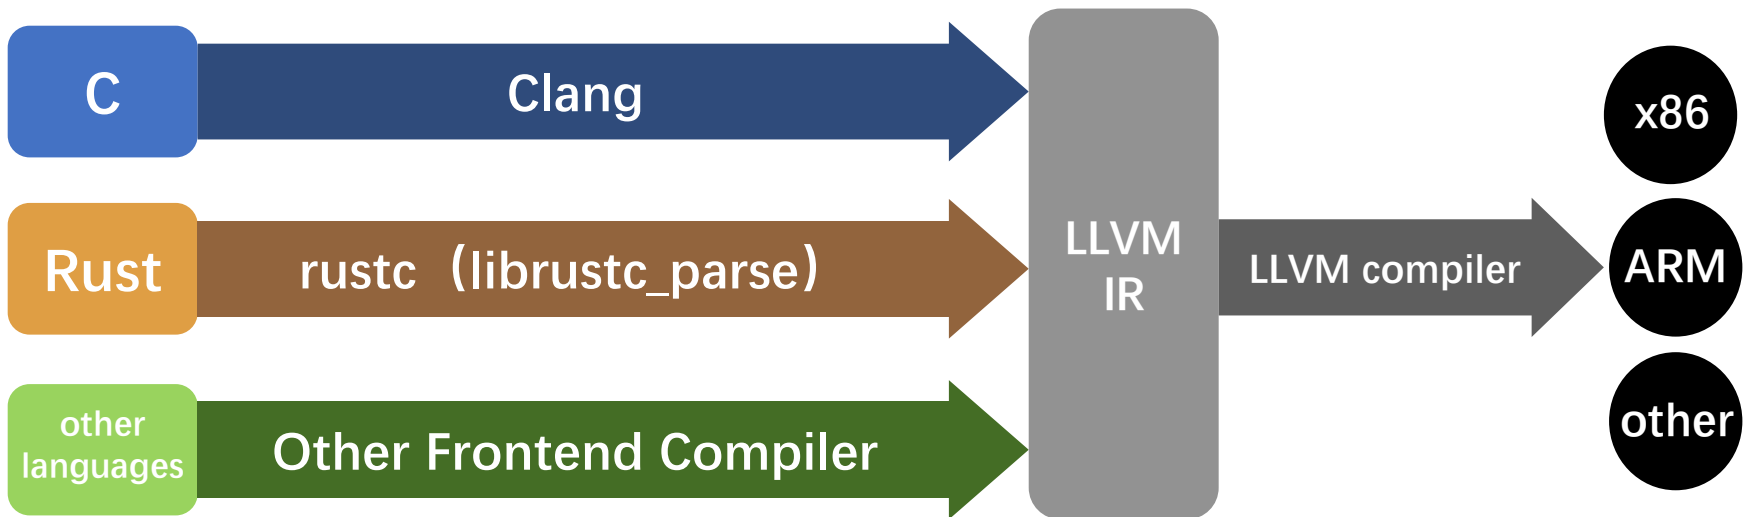

- Requirements Analysis
- Basic Design: simulation based on model (Energy is ignored)
- Detailed Design

## Low Level Virtual Machine Intermediate Representation (LLVM-IR)

### ■ LLVM-IR

- A **low-level programming language** used as the primary IR within the LLVM compiler framework
- Serves as **a bridge between high-level languages and the machine code**, enabling code analysis and transformation

# Contribution

---

## [Contribution 1]

A schema is proposed to describe the energy consumption of instructions

## [Contribution 2]

A method is proposed for extracting the working portion from generated code and transforming it into LLVM-IR

## [Contribution 3]

A software tool is designed to predict model energy consumption

# Contribution

---

## [Contribution 1]

A schema is proposed to describe the energy consumption of instructions

## [Contribution 2]

A method is proposed for extracting the working portion from generated code and transforming it into LLVM-IR

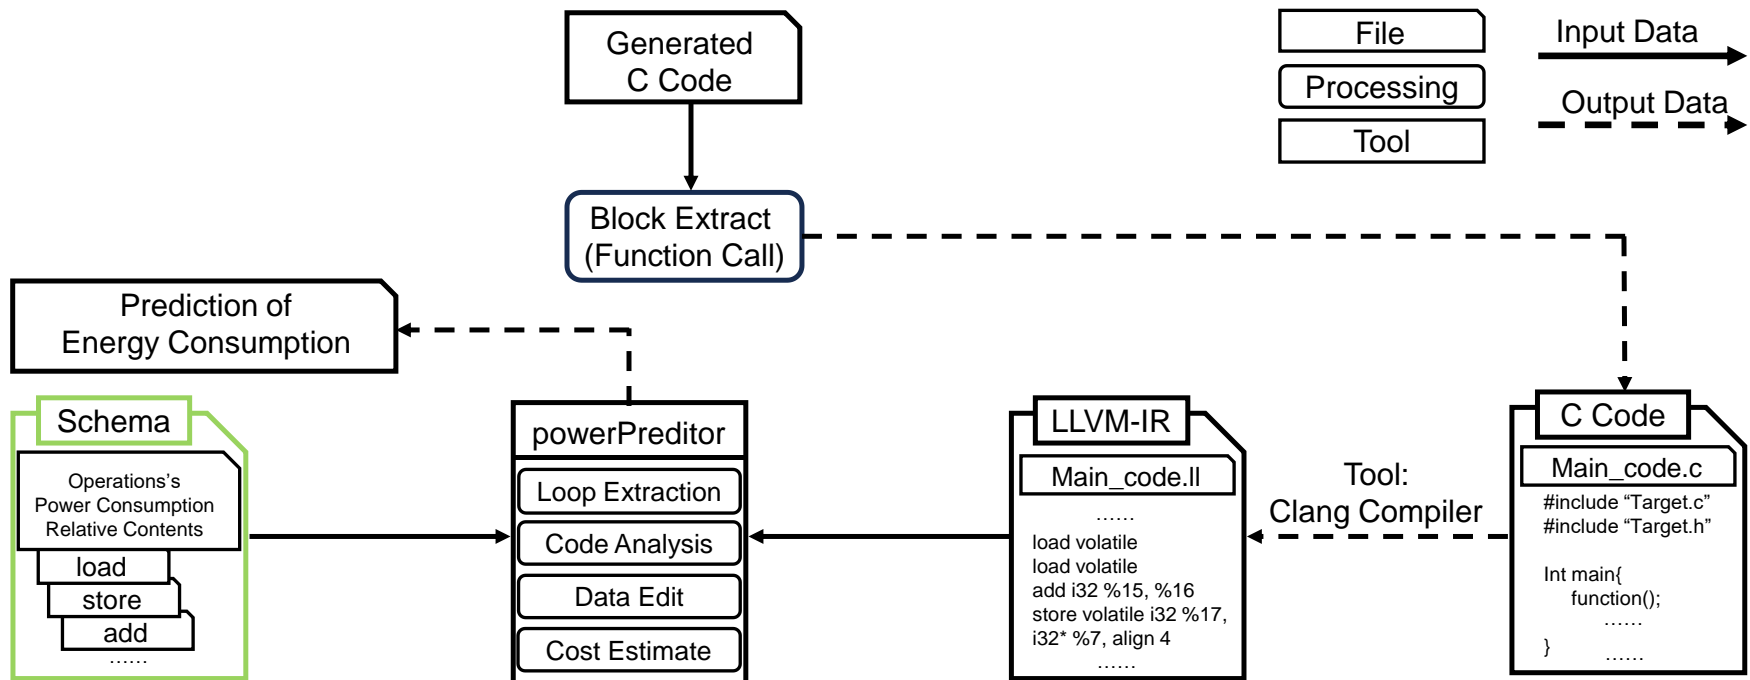

## [Contribution 3]

A software tool is designed to predict model energy consumption

# Energy Consumption Description Schema

## ■ Schema

- Provide a universal framework to describe energy consumption for any given instruction

# Energy Consumption Description Schema

---

## ■ Three-Tier Structure

- Top Layer
  - CommonInstructionSet
- Middle Layer
  - Instruction
- Bottom Layer
  - PowerConsumption

```
<CommonInstructionSet>  
  <Instruction name="example">  
    <PowerConsumption>  
      <Cost>1.000</Cost>  
      <Impact>0.000</Impact>  
    </PowerConsumption>  
  </Instruction>  
</CommonInstructionSet>
```

# Energy Consumption Description Schema

## ■ Acquisition Method

- Time and Energy
  - Execution time is directly linked to energy consumption
- Method
  - A cyclic execution approach is used for better precision in measuring individual instructions' time and energy use

Empty Body →

```
for (uint_t i = 0; i <= iteration; i++)  
{  
    asm volatile("nop")  
}
```

Measured Body →

```
for (uint_t i = 0; i <= iteration; i++)  
{  
    asm volatile("nop")  
    asm volatile(  
        "ADD %0, %1, %2\n\t"  
        : "=r" (r6)  
        : "r" (r4), "r" (r5));  
}
```

# Contribution

---

## [Contribution1]

A schema is proposed to describe the energy consumption of instructions

## [Contribution2]

A method is proposed for extracting the working portion from generated code and transforming it into LLVM-IR

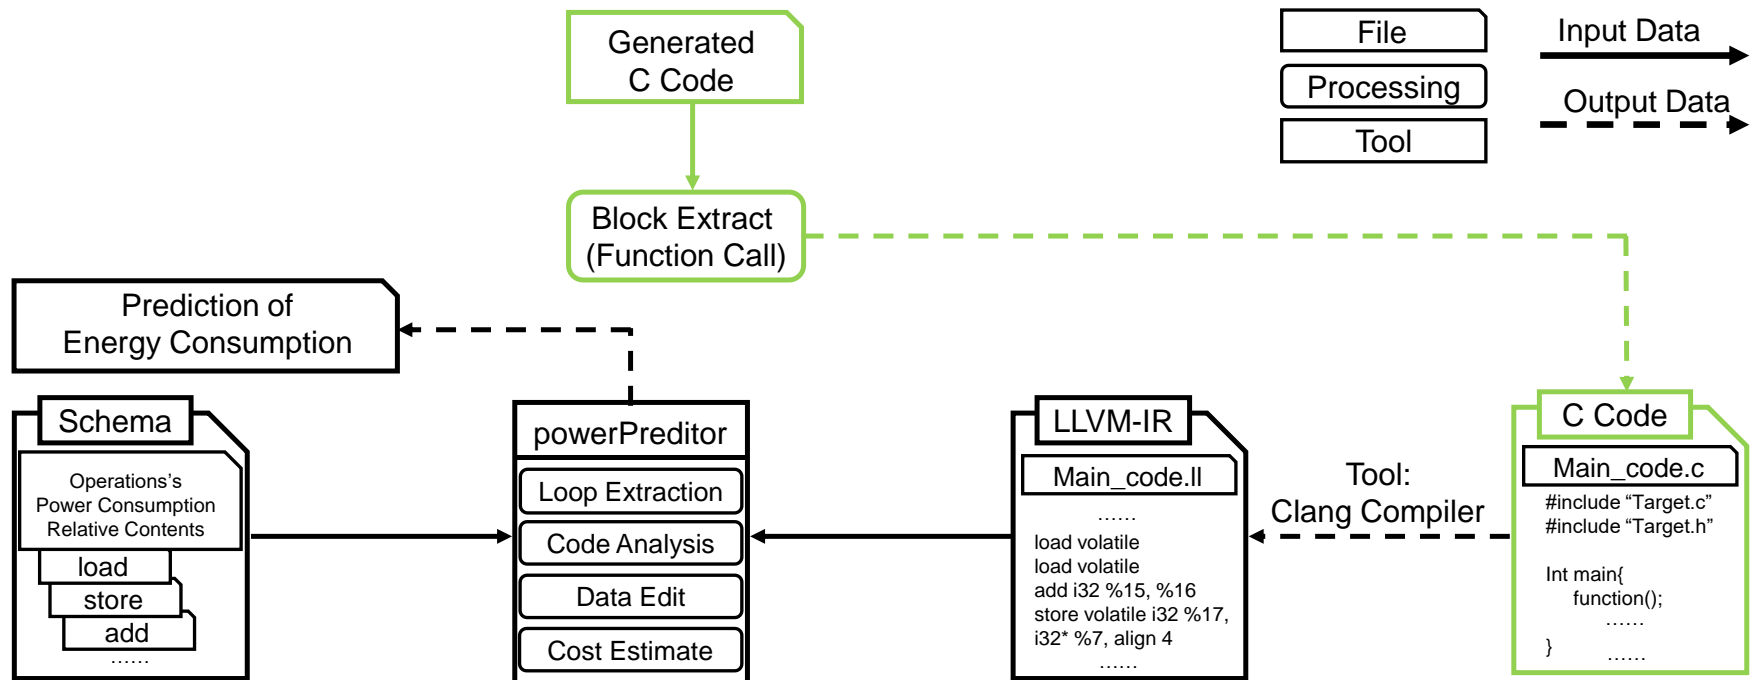

## [Contribution3]

A software tool is designed to predict model energy consumption

# Extracting Working Portion

## ■ Function Call

- Call the main function section in the generated file by means of a function call in the new c-file

# Contribution

---

## [Contribution1]

A schema is proposed to describe the energy consumption of instructions

## [Contribution2]

A method is proposed for extracting the working portion from generated code and transforming it into LLVM-IR

## [Contribution3]

A software tool is designed to predict model energy consumption

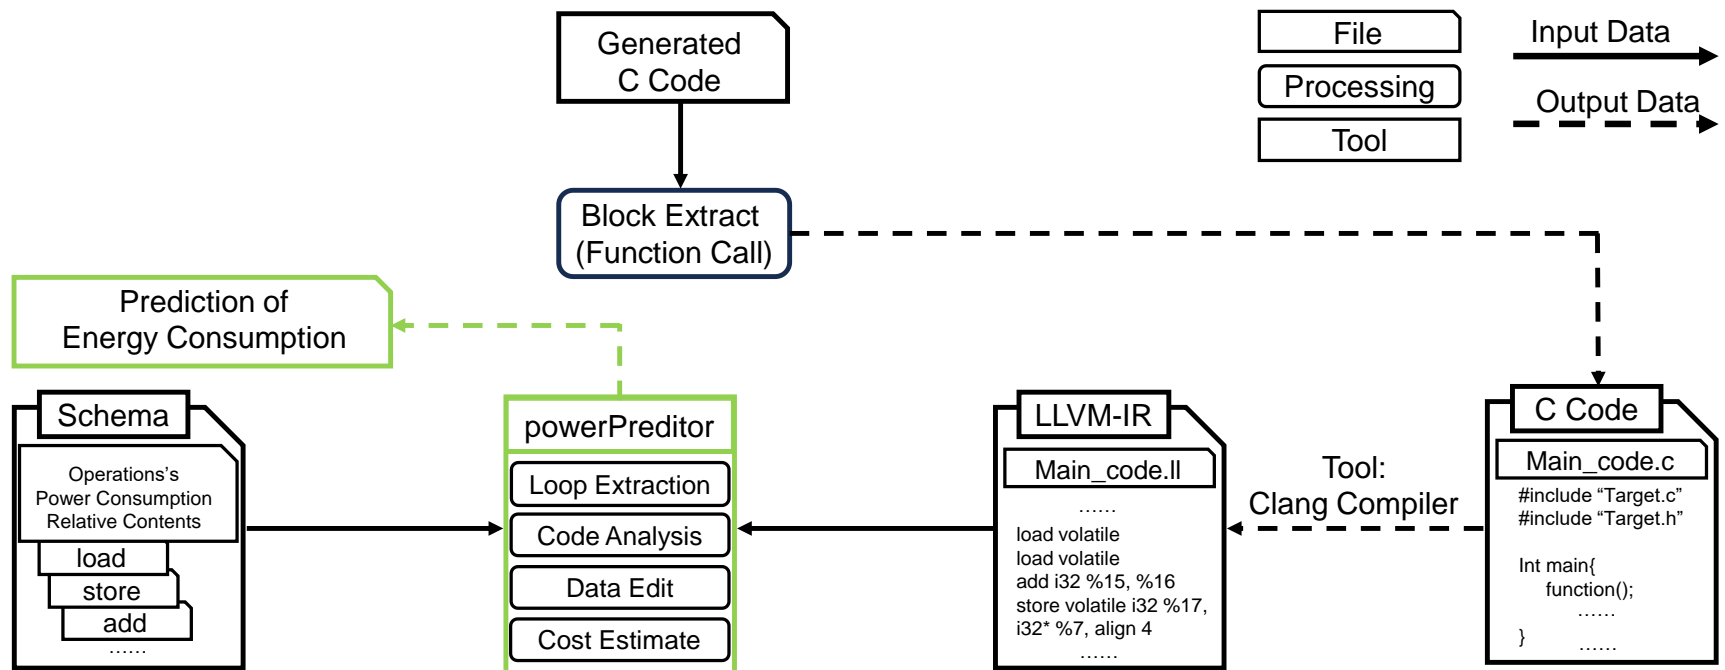

# Prediction Tool

## ■ Input

- Schema
- LLVM-IR Code

## ■ Output

- Prediction of code's energy consumption

## Comparison with Other Methods

	Modeling	Code Generation	Energy Consumption Measurement	Energy Consumption Prediction
MDD [7]	○	○		
Mercury [8]	○	○		
IEEE Access [9]			○	
SDK4ED [10]			○	○
J4CS [11]			○	○
PARTSim [12]			○	○
<b>This Paper</b>	○	○	○	○

Other approaches either focus purely on MBD or on code energy consumption prediction

Our research **fuses the prediction process into mbd, enabling code energy prediction at the primary stage of development**

# Experimental Environment

## ■Target device

- SONY Spresense (ARM Cortex M4F)

## ■Measurement device

- AVHzY CT-3 USB tester

# Experimental

## ■ Basic Evaluation

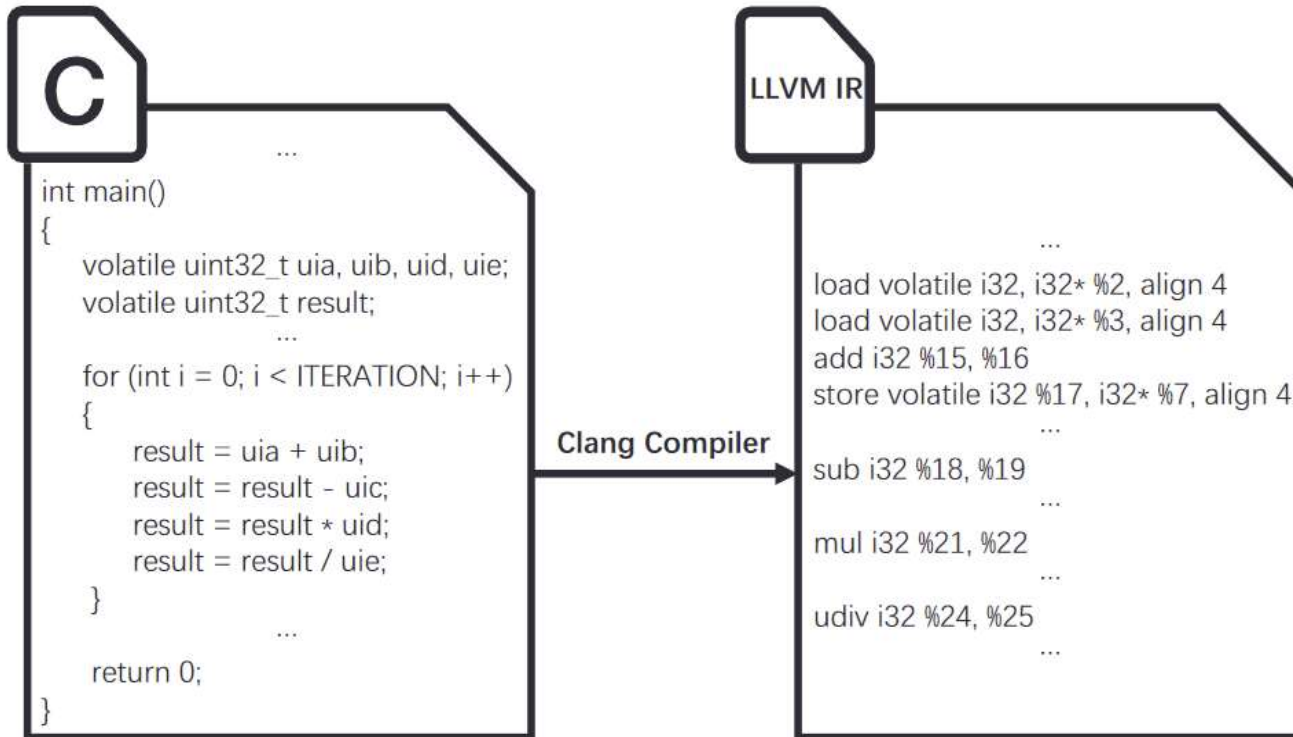

- Measure the **power consumption** and **execution time** of basic **instructions** on the target device
- Create **test scripts** to obtain actual execution time and power consumption in a single core environment

# Experimental

## ■ Basic Evaluation

- Test Scripts
  - Four arithmetic operations (add, sub, mul, and div)
- Predicting power consumption
  - Focus on the “for” statement part

# Experimental

## ■ Basic Evaluation

	Number of Execution	Total Time (clock cycles)	Total Energy (nanojoules)
load	8	16.018	13.248
store	4	4.005	3.456
add	1	1.001	0.864
sub	1	1.001	0.864
mul	1	1.001	0.864
udiv	1	5.006	3.888
<i>for</i>	1	4.007	3.24
<b>Total</b>		<b>32.039</b>	<b>26.424</b>

Time and Energy Consumption of Instructions

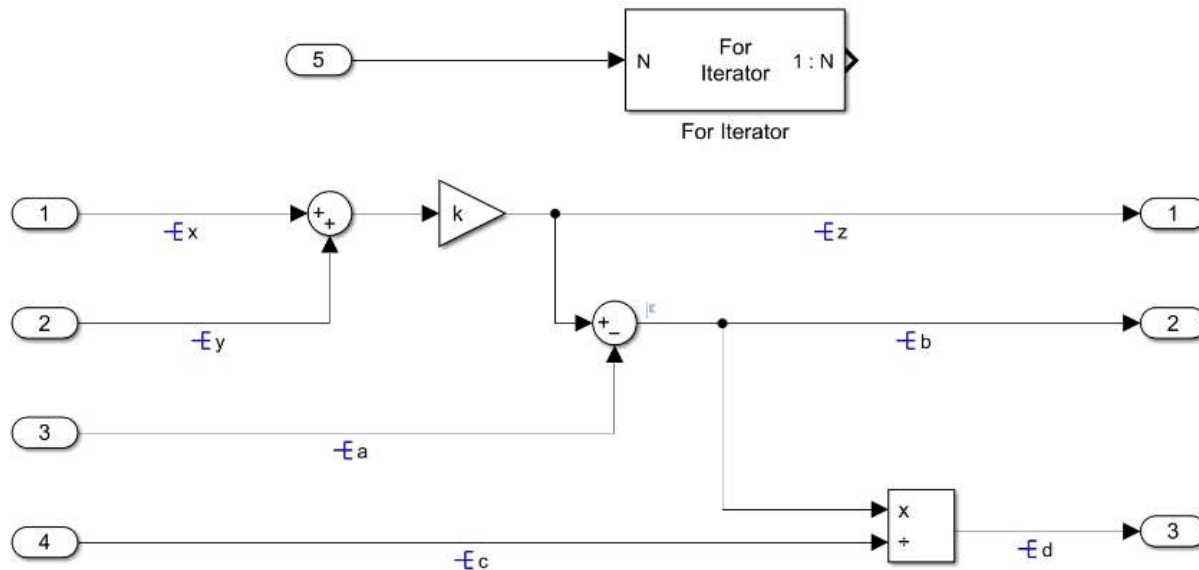

Power Consumption Prediction Focus on “for”

# Experimental

## ■ Evaluation with Models

Overall Model Construction

For Iterator Subsystem Construction

# Experimental Environment

---

## ■ Evaluation with Models

- Code generated by Embedded Coder
- Execute in user code with function calls
- Convert to LLVM-IR instructions
- Make predictions with proposed tool

```
for (si_iter = 1; si_iter <= temp; si_iter ++)  
{  
    z = ( x + y) * k;  
    b = z - a;  
    d = b / c;  
}
```

# Experimental Environment

## ■ Evaluation with Models

### - Result

- Prediction
  - 2,059,200,000 nJ
- Measurement
  - 1,980,000,000 nJ
- **Error: 4%**

### - Error Analysis

- Focus on “for” statement
  - Other codes’ ignored
- Precision of the equipment
  - 1,000 times per second

The screenshot shows the 'powerPredictor' application window. It has a light blue title bar with a question mark and a close button. The interface is divided into two main sections. The top section contains several checkboxes, each with a green checkmark, and corresponding buttons. The bottom section displays a table with four columns: 'Instruction', 'No. of executions', 'Cost', and 'Impact'. Below the table, there is a horizontal line.

**Configuration Options:**

- ☒ Code Select (.c) [Select]
- ☒ Code Transform
- ☒ Loop Extraction
- ☒ Code Analyse
- ☒ Match Check [Check]
- ☒ Data Import (.xml) [Select]
- ☒ Data Check
- 3.24 [Calculate]
- ☒ Calculated
- ☒ Power Estimate

**Results:** 2059200000 nanojoules

	Instruction	No. of executions	Cost	Impact
1	load	500000000	828000000.000	
2	udiv	100000000	388800000.000	
3	sub	100000000	86400000.000	
4	br	100000000	0.000	
5	store	300000000	259200000.000	
6	mul	100000000	86400000.000	
7	add	100000000	86400000.000	

# Conclusions

---

## ■ Proposed Method

- Schema Construction: a structured approach to modeling energy consumption
- Module Extraction: parts of the model relevant to energy consumption
- Energy Consumption Prediction Tool: software to predict energy consumption

## ■ Contribution

- Provide a robust method for estimating energy requirements in embedded systems

## ■ Evaluation

- Validate the availability of schema through basic evaluation
- The usability of the method in Model-based Development is verified by means of actual model
